# Impact of COVID-19

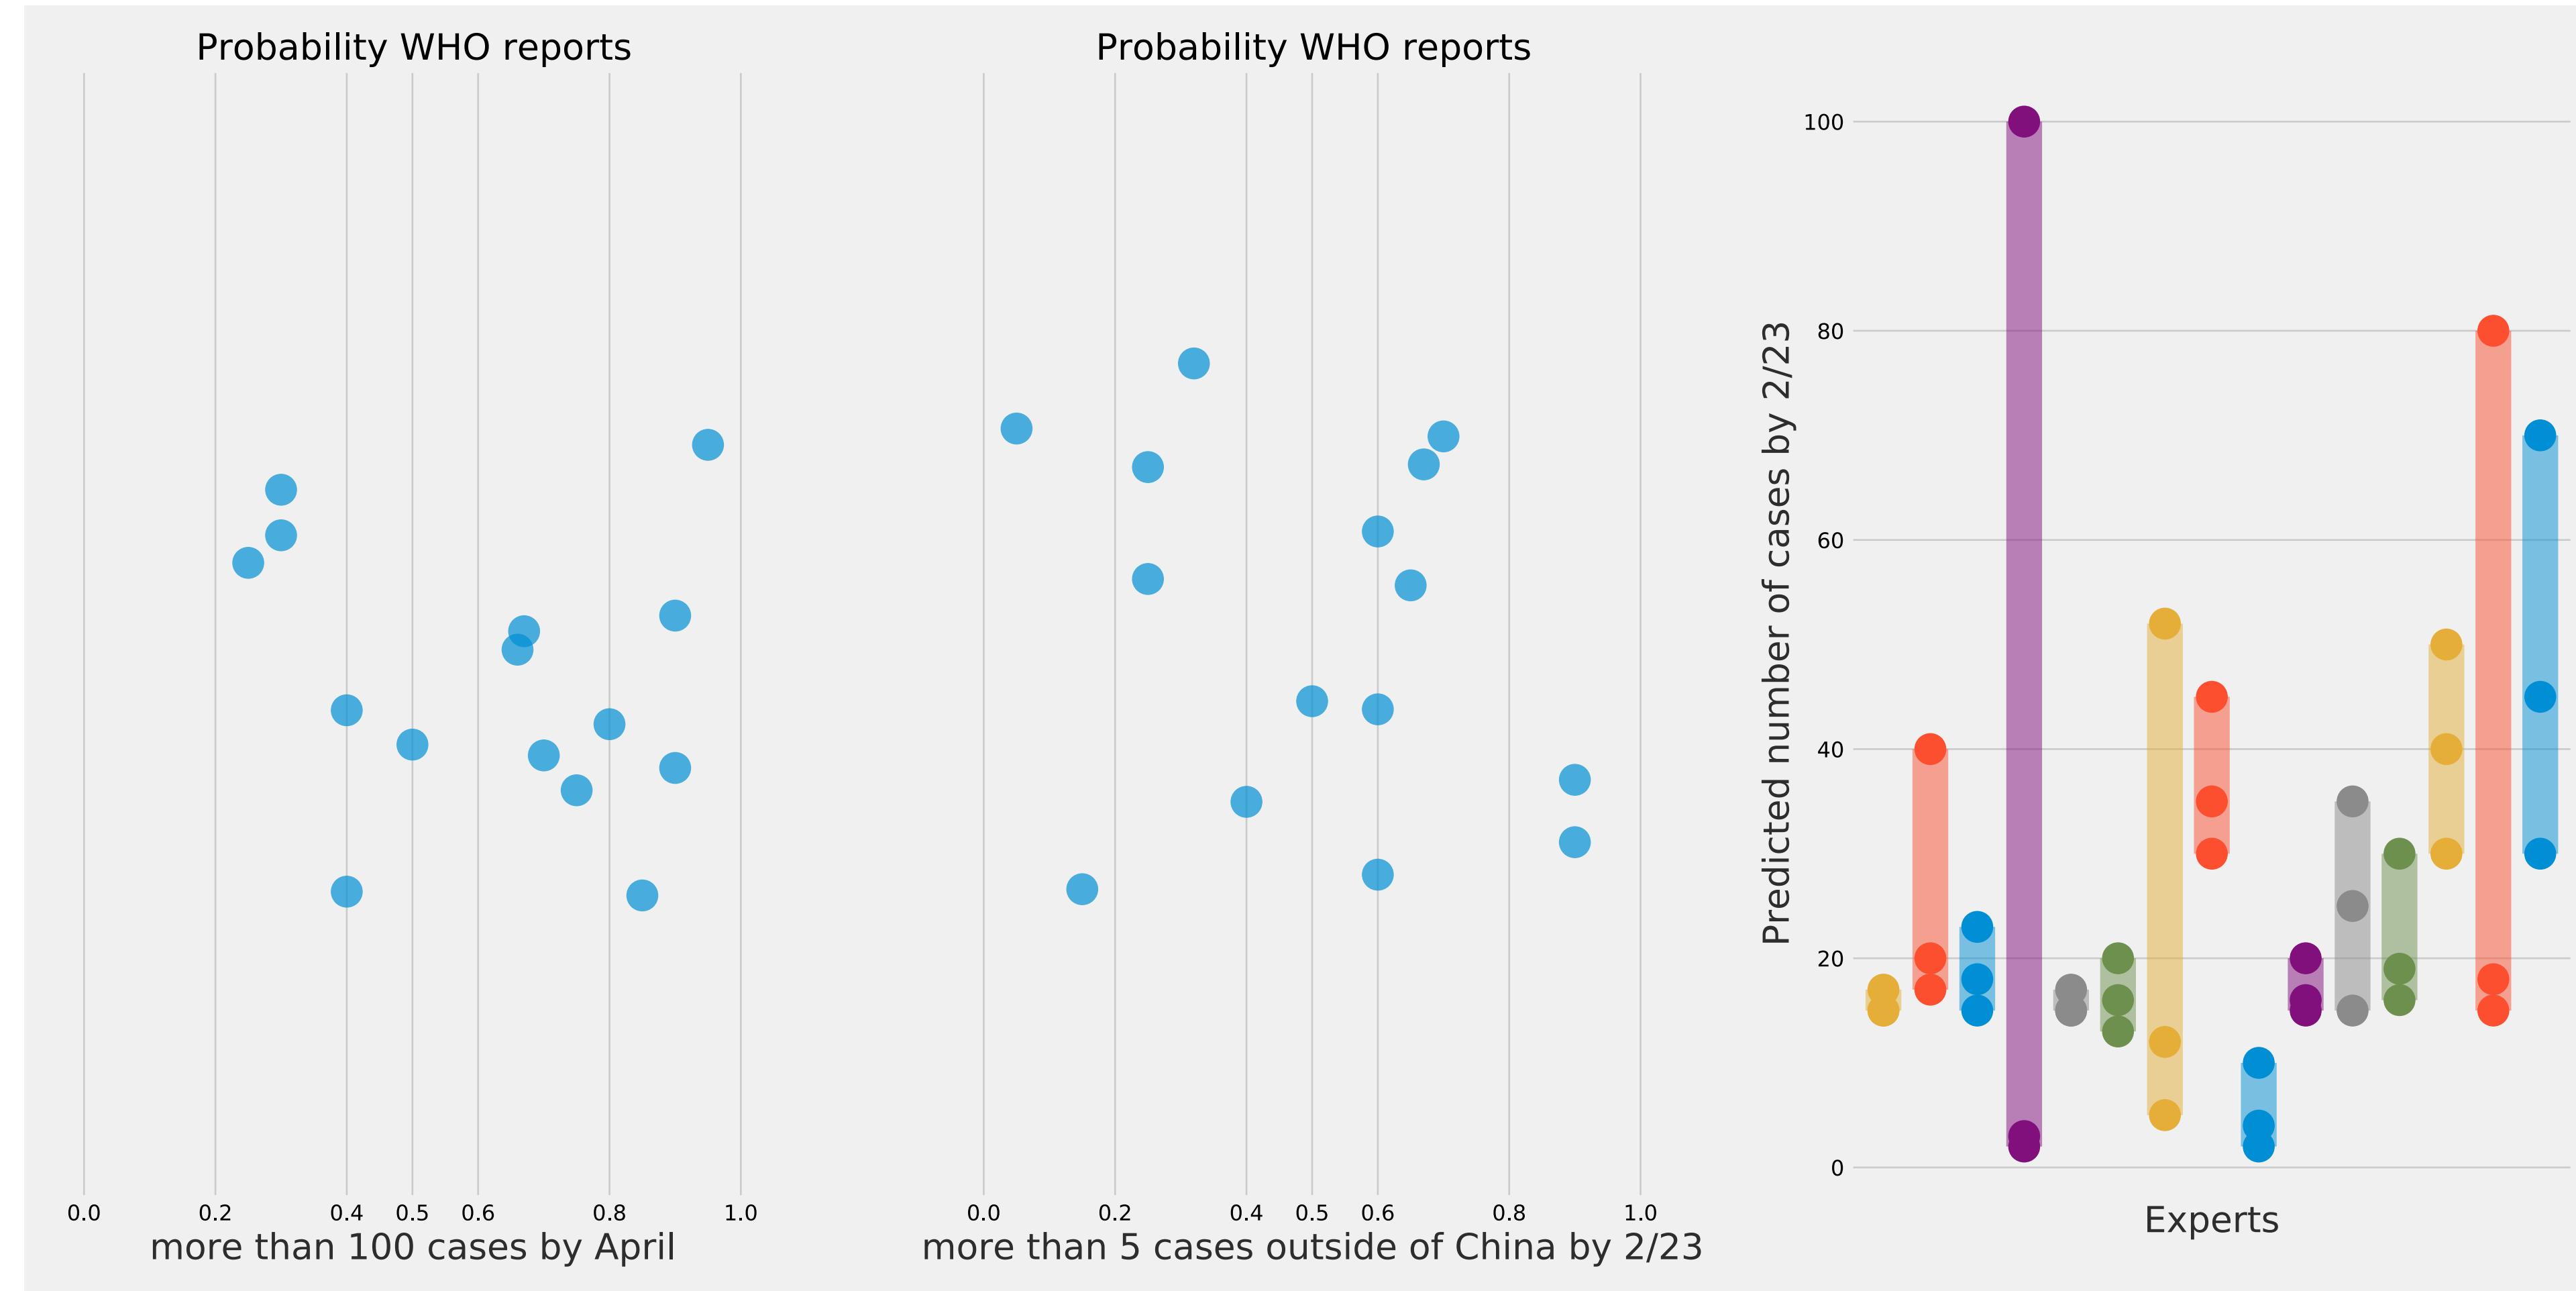

## February 17th Questions

Do you think that the confirmed case count of COVID-19 cases in the US reported by WHO on April 1, 2020 will exceed 100?

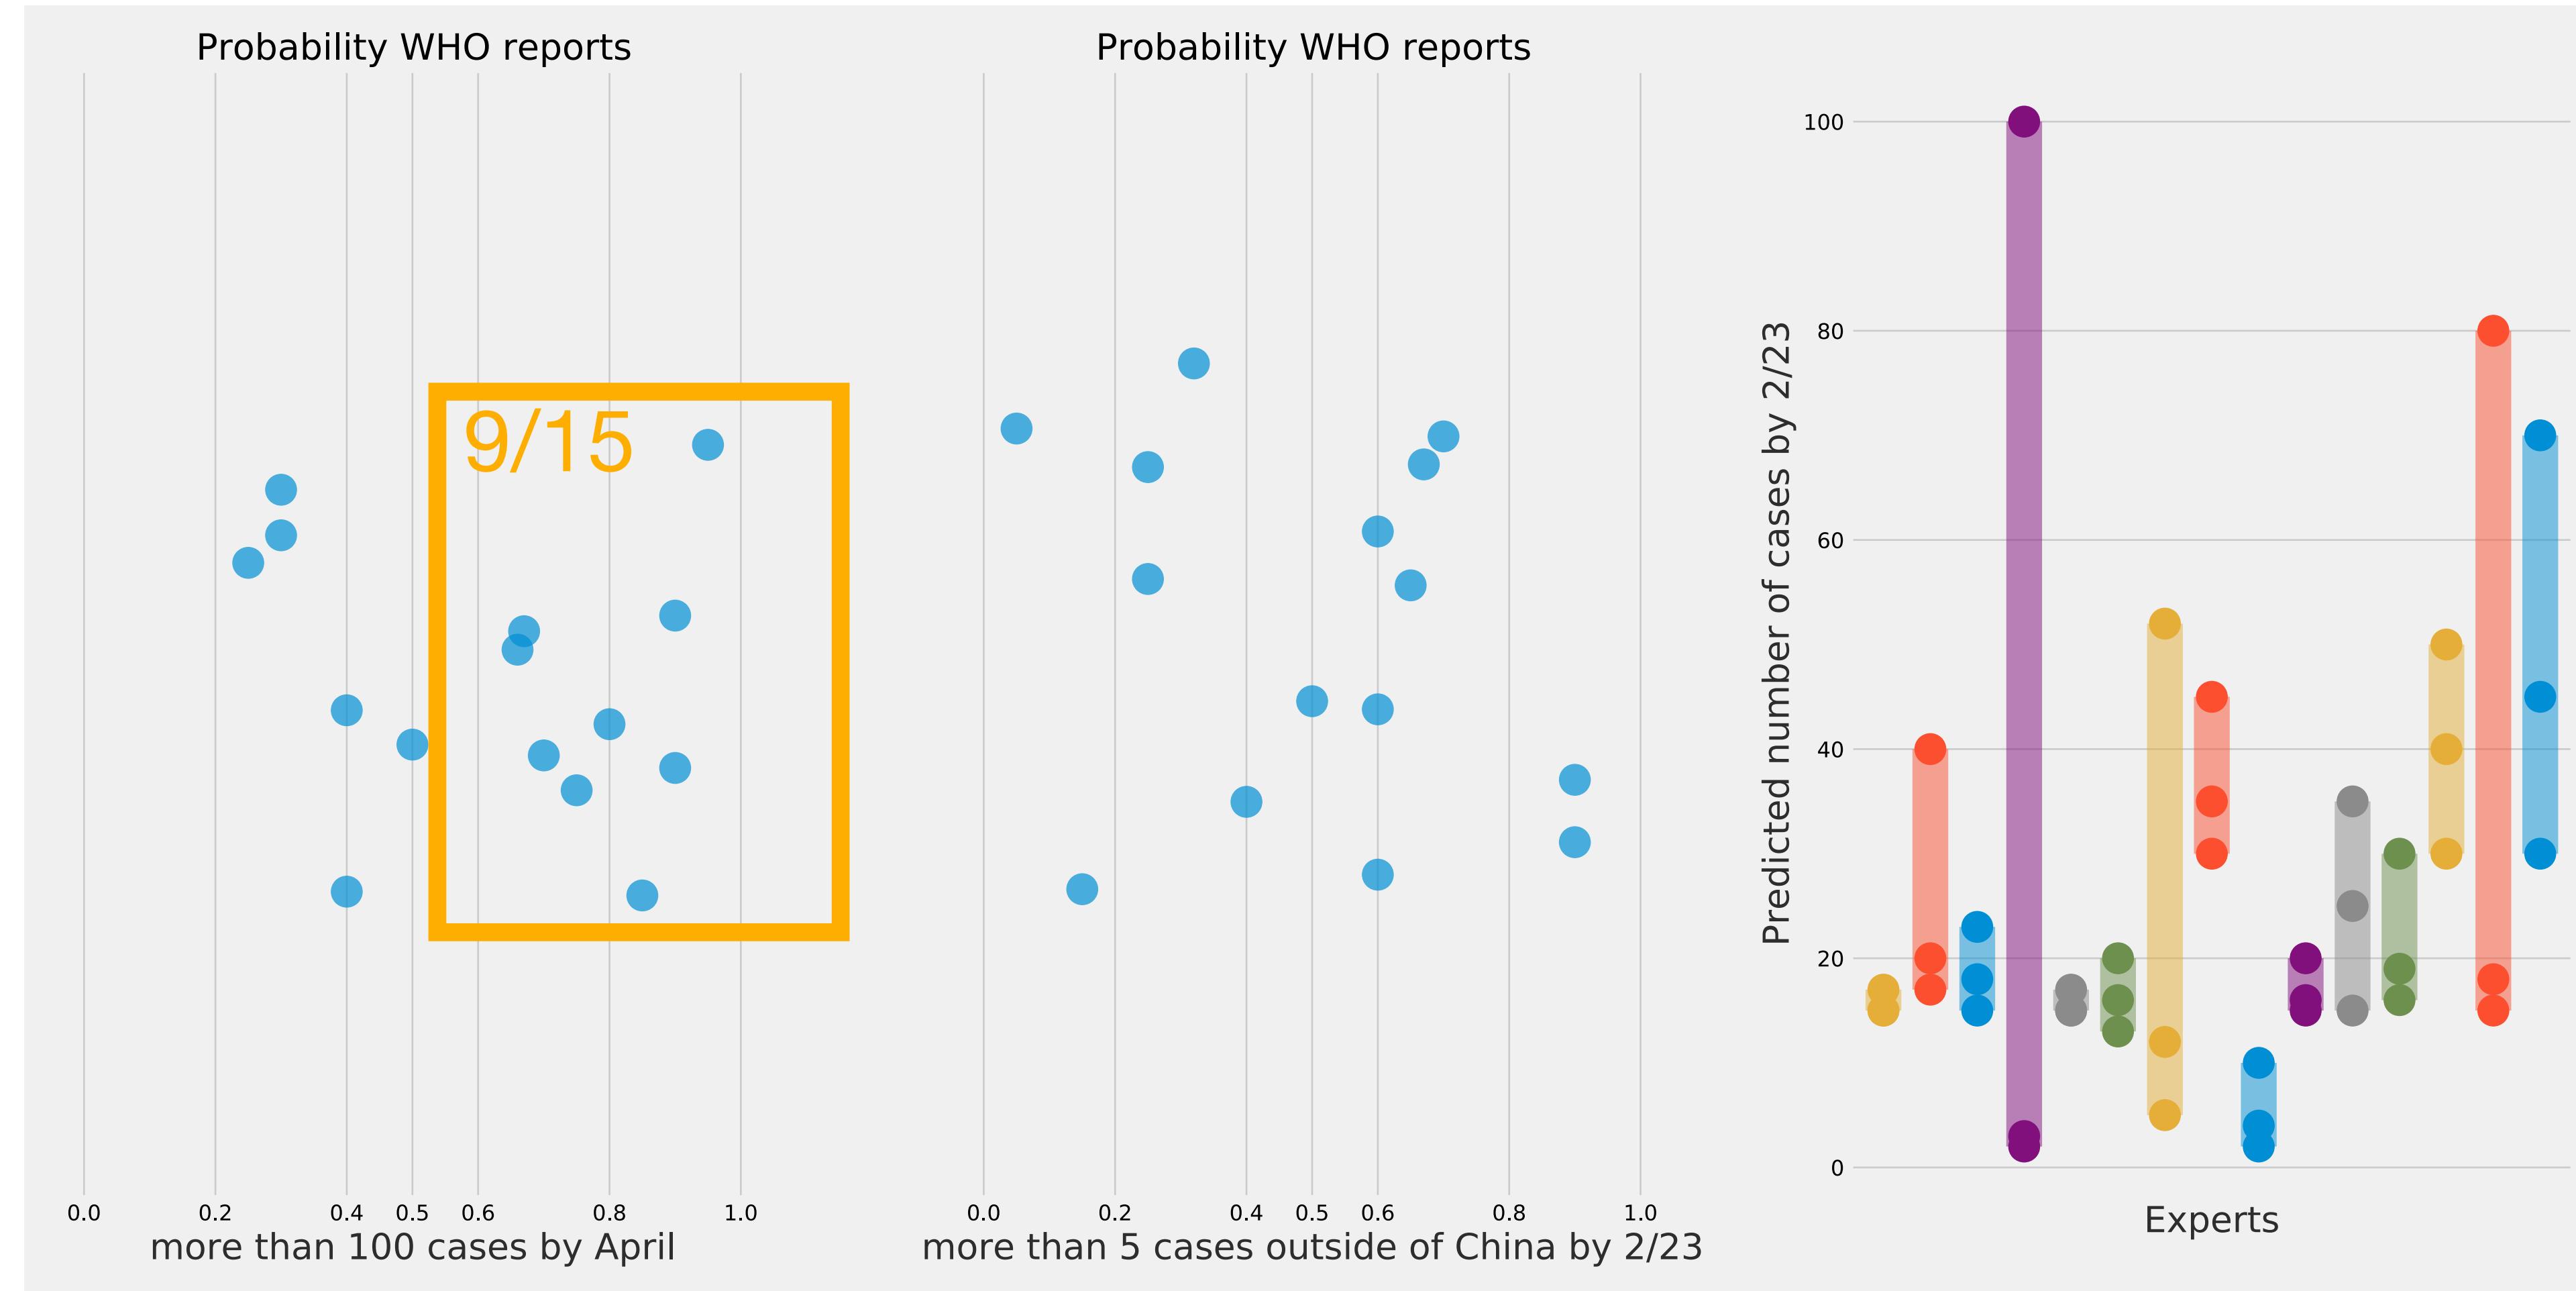

As reported by the WHO this coming Sunday, 2020-02-23, will the number of cumulative confirmed cases in the US with possible or confirmed transmission outside of China exceed 5?

What is the smallest, most likely, and largest number of all cumulative confirmed cases (including both imported cases and local transmission) in the US the WHO will report this coming Sunday 2020-02-23?

# Survey logistics

Dear Dr. [REDACTED]

Thank you for your previous participation in our project to aggregate expert opinion on the future trajectory of the COVID-19 outbreak. Please find attached the results from last week's survey: [20200429 covid19 expert report v0.1](#)

The names of experts who participate more than once will be made public, as will their participation rates, as we believe this will give more credence and transparency to the results. Your answers, as well as those from other experts, will be anonymized and shared publicly and with stakeholders at the US CDC. If you participated in last week's survey, your forecasts and the results from COVID tracker are included below.

We hope you will continue to participate in this brief weekly survey. To fill out this week's survey, please click the personalized link below. The survey will be open until 4:00pm on Tuesday, May 5th.

## **Follow this link to the Survey:**

# Survey platform

As shown in the table and figure above, [COVID Tracker](#) reported 1,322,807 total positive cases of COVID-19 in the US as of Monday, May 11th at 9am.

What is the number of positive cases in the US that COVID Tracker will have in the daily report this coming Sunday, May 17th?

We provided a set of intervals where the true number of positive cases could fall. Assign a probability to each bin corresponding to your belief of how many cases will be reported next Sunday. Each number must be between 0 and 1 and all numbers provided must sum to 1.

A smartphone screen showing a mobile application interface. The top status bar indicates signal strength, battery level (100%), and a signal icon. The main screen displays the same COVID-19 case tracker graph as the desktop version, with the title 'Total number of positive COVID-19 cases in the US'. The graph shows the cumulative positive cases over time, starting from March 15th. The app interface includes a navigation bar with four dots and a back arrow, and a footer bar with icons for signal, battery, and a small square.

# Predictions

Mar 23rd: Varied social distancing practices begin.  
Mar 16th: The number of new cases begins to show signs of exponential growth. Foreign travel is restricted.

Apr 12th-15th: The US reports 22,000 deaths, surpassing Italy's death toll. The White House signals social distancing guidelines may be relaxed.

May 1st: The FDA issues an Emergency Use Authorization that allows the drug remdesivir to be distributed in the US to treat COVID-19.

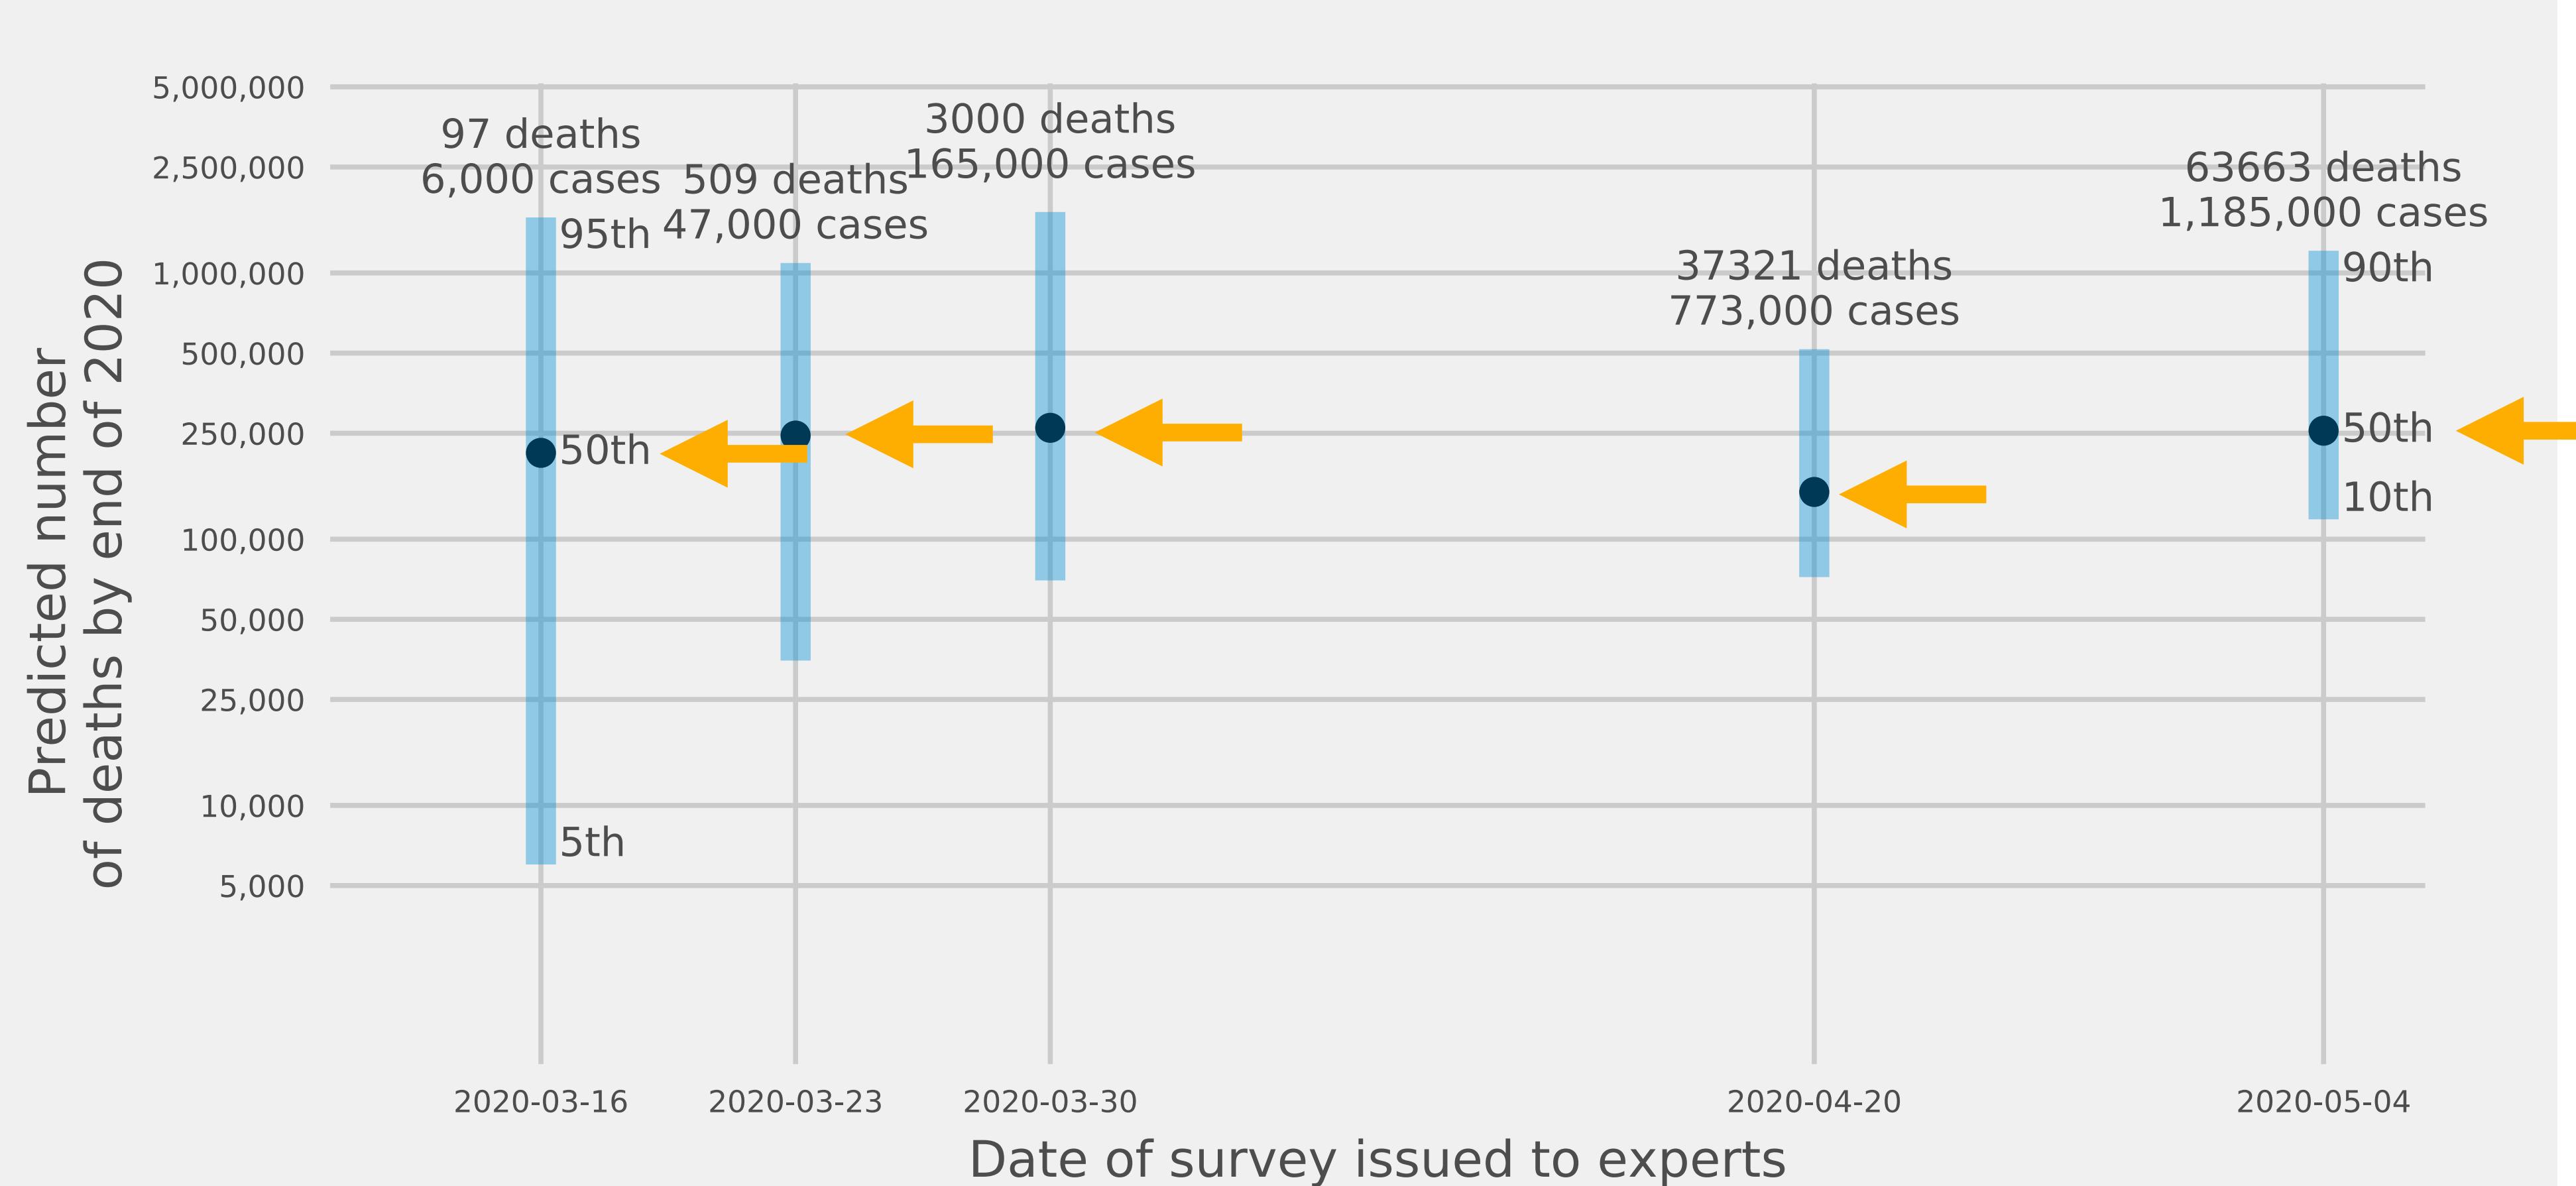

150K - 250K deaths by the end of 2020

Stable predictions

Broad uncertainty

## Predictions

As shown in the table and figure above, [COVID Tracker](#) reported 751,062 total confirmed cases of COVID-19 in the US as of Monday, April 20th at 9am. What is the number of total confirmed cases in the US that COVID Tracker will have in the daily report this coming Sunday, April 26th?

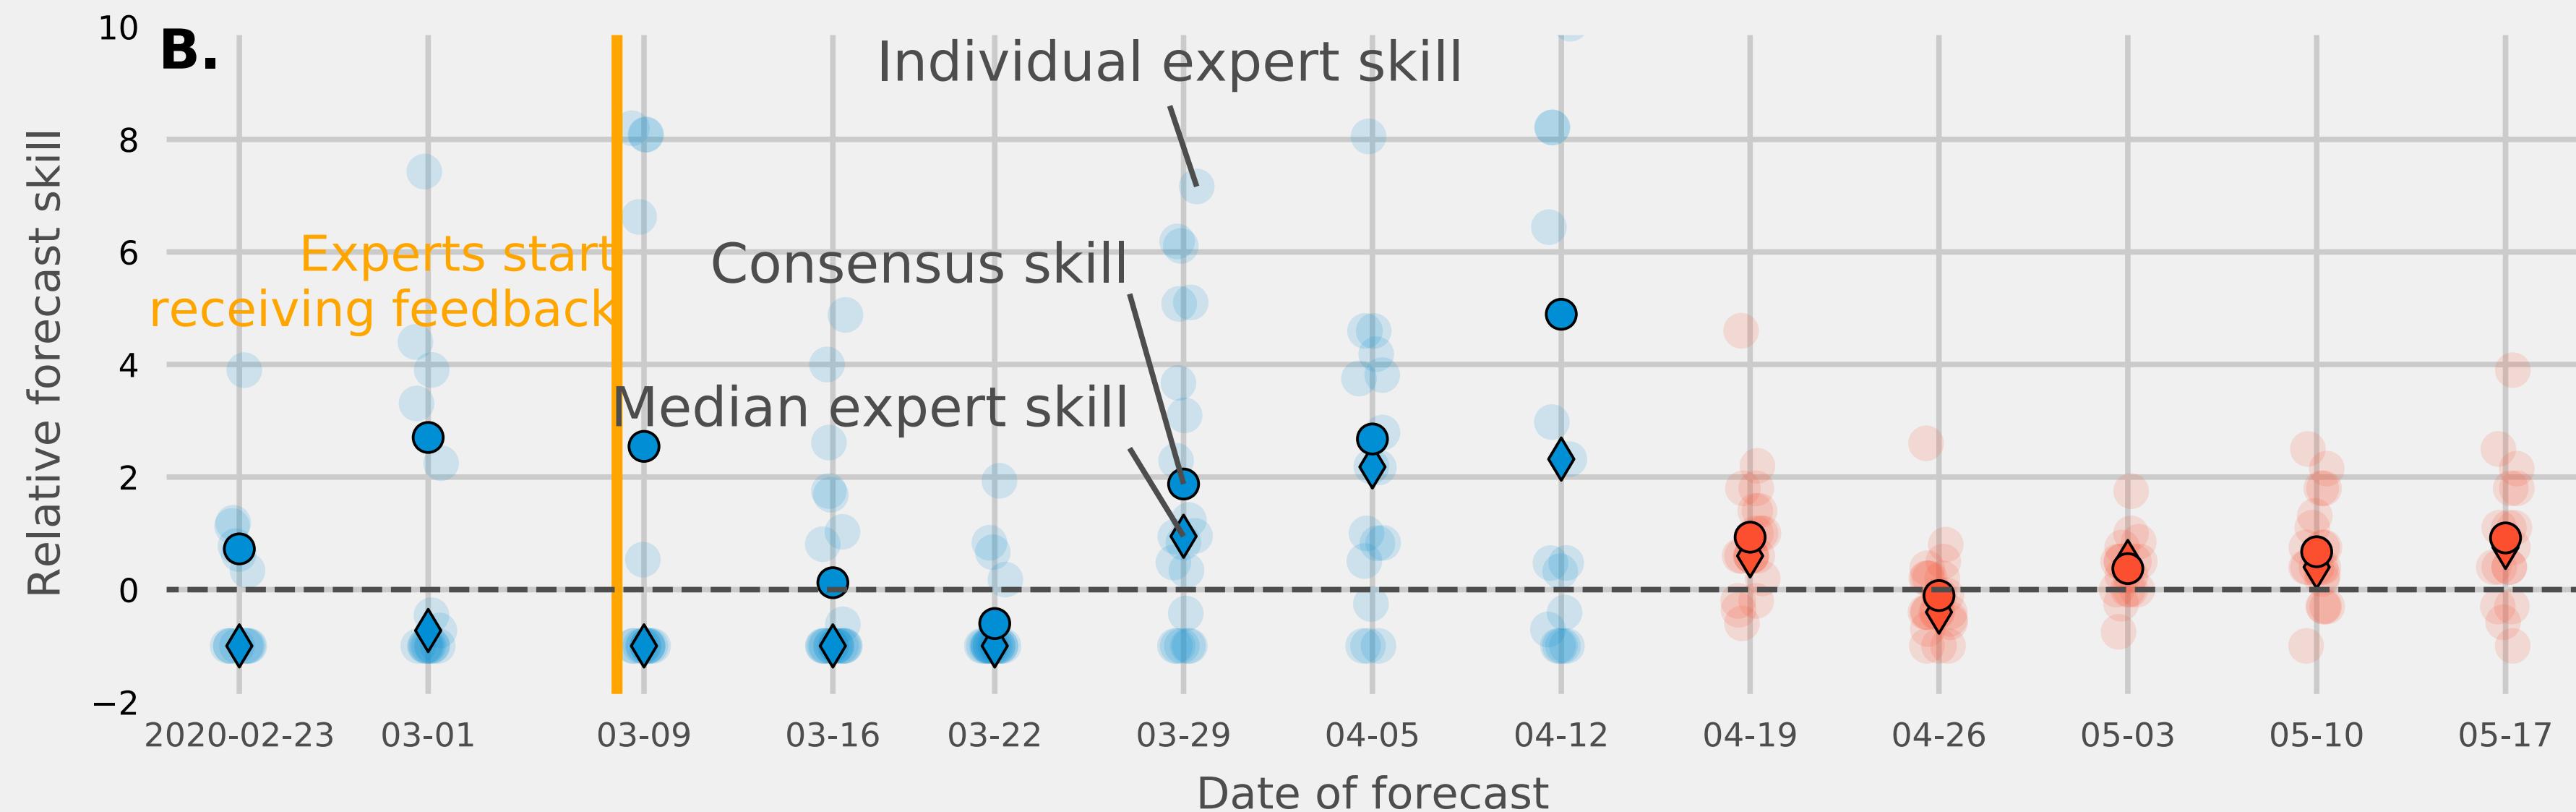

We provided a set of ranges of possible confirmed cases. Assign a probability to each bin corresponding to your belief of how many cases will be reported next Sunday. Each number must be between 0 and 1 and all numbers provided must sum to 1.

Less than 850,000 - [0,850,000]	<input type="text" value="0"/>
Greater than 850,000 and less than or equal to 900,000 - (850,000, 900,000]	<input type="text" value="0"/>
Greater than 900,000 and less than or equal to 950,000 - (900,000, 950,000]	<input type="text" value="0"/>
